

VU006

© syntonie.fr - 2020

Quadrature oscillator ▸ User documentation / build guide

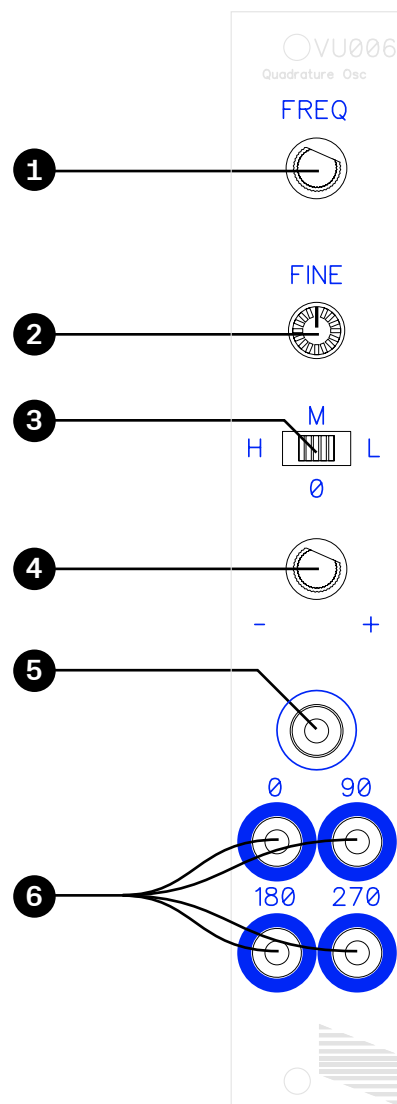

The VU006 is a low frequency to audio rate quadrature oscillator, outputting 4 sine waves 90 degrees apart. Based around two self-oscillating filters, it features a buffered frequency modulation input with attenuverter, a switch to select from 3 frequency ranges and a trimmer pot for fine tuning.

Specifications

- 4HP
- 30 mA +12V
- 28 mA -12V
- 0 mA +5V
- 50mm deep

Special thanks to: **Ian Fritz** for the self-oscillating filters design from the ChaQuO and **Yves Usson/Yusynth** for his take on Fritz design, using transconductance amplifiers in place of op-amps, allowing for external voltage control / **Lorenzo Ferronato** for the documentation design // And of course, **everyone who has supported Syntonie until now & those who will support it in the future.**

- (1)** Set the oscillator's frequency
- (2)** Set frequency of the oscillator (10 times finer than FREQ)
- (3)** Set the frequency range : Low (0.02Hz to 10Hz), Mid (6Hz to 2.5kHz)
- (4)** Attenuates and/or inverts the signal coming from FM input
- (5)** FM input 0-1 / 0-1V, 100k ohm
- (6)** Sinewave outputs / 0-1V, 499 ohm

- The FM attenuverter can be used as an additional tuning pot by connecting the FM input to a 1V source, allowing for even slower cycles.
- In High range the sinewaves remain consistent up to about 15kHz, they then start distorting resulting in a clipped sinewave.

■ [Use the interactive BOM regarding component placement](#) / [Find the BOM here](#)

Place and solder the components in the following order:

- **1** Resistors (**be careful not to short leads** as resistors are standing vertically)
- **2** Diodes (**pay attention to the orientation**)
- **3** Capacitors
- **4** IC sockets/ICs (**pay attention to the orientation**)
- **5** 8 pin header & socket (**pins go on the solder side, socket on the component side**)
- **6** 2 pin header (**pins are soldered on the component side, header socket is on the solder side**)

Q1 comes presoldered with the pcb set & full kit.

■ **Use the interactive BOM to look for component placement** / [Find the BOM here](#)

Place and solder in this order :

- **1** Resistors
- **2** Capacitors (**C3** and **C4** need to be **bent and fitted on the solder side**)
- **3** Jacks (**solder one pin and check that the part is sitting straight**, if so solder all the other pins)
- **4** Potentiometers/Tall trimmers (**same as above**)
- **5** Switch (**same as above**)
- **6** 8 pin sockets (**soldered on component side, socket on the solder side**)
- **7** 2 pin header (**soldered on component side, socket on the solder side**)

■ [Use the interactive BOM to look for component placement](#) / [Find the BOM here](#)

Place and solder in this order :

- **1** Resistors
- **2** Capacitors (**pay attention to the orientation of the electrolytic capacitors**)
- **3** Diodes (**pay attention to the orientation**)
- **4** Ferrite beads
- **5** Voltage reference
- **6** IC sockets/IC
- **7** 8 pin headers (**short pins on the component side, box header on the solder side**)

- (1) 6mm M3 screw
- (2) 12mm M3 spacer
- (3) 10mm+6mm M3 spacer
- (4) 6mm M3 screw

Stackable headers pins can be trimmed of 1-2mm to make distance between both boards closer to 12mm

- **Rev B:** initial release
- **Rev C:** voltage ref footprint fixed on Powerboard

Note: first pcb sets includes Control Rev B, Main Rev B and Power Rev C
